

RETAIL PERFORMANCE & TARGET ANALYTICS

Power BI Dashboard for Sales, Profitability and Target Achievement

Submitted By: Ramalah Amir

1. Dataset

Dataset Title

Retail Performance & Target Analytics — Pakistan Retail Chain

Number of Worksheets, Rows & Columns

The raw workbook contains five source worksheets that were imported into Power Query and transformed into the final star-schema model:

Raw Worksheet	Raw Rows	Final Table	Purpose
Raw_Sales	920	FactSales	Transaction-level sales fact table
Raw_Customers	255	DimCustomer	Customer dimension
Raw_Products	63	DimProduct	Product / price / cost master data
Raw_Stores	16	DimStore	Store / location dimension
Raw_Targets	342	FactTargets	Monthly sales & profit target fact table

2. Data Cleaning

Data cleaning was performed in Power Query for all five Raw_* source tables. Each Raw_* query was kept as a staging query, and a separate cleaned query was created for each final table (FactSales, DimCustomer, DimProduct, DimStore, FactTargets) rather than editing the source in place. All transformation steps are documented in the Applied Steps pane and are fully reproducible.

Raw_Sales → FactSales

Raw:

	Transaction_ID	Order_Date_Raw	Customer_ID	Product_ID	Store_ID
	Valid 100% Error 0% Empty 0%	Valid 99% Error 0% Empty < 1%	Valid 99% Error 0% Empty < 1%	Valid 99% Error 0% Empty < 1%	Valid 99% Error 0% Empty < 1%

3. Data Model & Organization

The cleaned queries were loaded into a star-schema model consisting of two fact tables (FactSales, FactTargets) and five dimension tables (DimCustomer, DimProduct, DimStore, DimDate, DimMonth). All relationships are single-direction, one-to-many, with filters flowing from dimensions to facts — no bidirectional relationships were used.

Why FactSales and FactTargets Are Not Linked Directly

FactSales is transaction-grain (one row per sale, with a daily Order_Date) while FactTargets is monthly-grain (one row per Store per Month_Start). Linking these two fact tables directly would violate star-schema design and risk double-counting. Instead, a DimMonth bridge table (one row per calendar month) connects to both FactSales and FactTargets on Month_Start, allowing actual performance to be compared against monthly targets without a fact-to-fact relationship. DimDate, marked as the model's official date table, is used separately for daily trend analysis and time-intelligence functions such as YoY growth.

Relationship Map

From Table	Relationship	To Table	Key
DimCustomer	1 → *	FactSales	Customer_ID
DimProduct	1 → *	FactSales	Product_ID
DimStore	1 → *	FactSales	Store_ID
DimStore	1 → *	FactTargets	Store_ID
DimMonth	1 → *	DimDate	Month_Start
DimDate	1 → *	FactSales	Date / Order_Date
DimMonth	1 → *	FactTargets	Month_Start

All technical key columns (Customer_ID, Product_ID, Store_ID) were hidden from report view while remaining visible in Model view for relationship validation, per the project's modelling guide.

4. Calculated Columns

In addition to the DAX measures used for analysis, the following calculated columns were created to support segmentation and report-friendly sorting:

Column	Table	Purpose
Age_Group	DimCustomer	Buckets customer Age into ranges (e.g. 18–25, 26–35, 36–45, 46–55, 56+) for segment-level analysis
Month_Start	FactSales / FactTargets	Standardized first-of-month date used as the bridge key to DimMonth
Month Name / Quarter labels	DimDate	Human-readable calendar labels used in slicers and axis labels
Month sort column	DimDate / DimMonth	Numeric sort-by column so month names display in chronological rather than alphabetical order

```

1 Age_Group =
2 SWITCH(
3     TRUE(),
4     DimCustomers[Age] < 25, "18-24",
5     DimCustomers[Age] < 35, "25-34",
6     DimCustomers[Age] < 45, "35-44",
7     DimCustomers[Age] < 55, "45-54",
8     "55+"
9 )

```

6. DAX Measures & Analysis

Nineteen DAX measures were created in a dedicated _Measures table to keep all business logic centralized and separate from the data tables.

Core Revenue & Profitability Measures

Measure	Formula	Business Meaning
Gross_Sales	SUMX(FactSales, Quantity × Unit_Price)	Revenue before any discount is applied

Measure	Formula	Business Meaning
Discount_Amount	$\text{SUMX}(\text{FactSales}, \text{Quantity} \times \text{Unit_Price} \times \text{Discount_Percentage} / 100)$	Rupee value given away in discounts
Net_Sales	$\text{Gross_Sales} - \text{Discount_Amount}$	Actual billed revenue
Total_Cost	$\text{SUMX}(\text{FactSales}, \text{Quantity} \times \text{RELATED}(\text{Unit_Cost}))$	Cost of goods sold, pulled from DimProduct
Gross_Profit	$\text{Net_Sales} - \text{Total_Cost}$	Profit after cost of goods
Profit_Margin	$\text{DIVIDE}(\text{Gross_Profit}, \text{Net_Sales})$	Profit efficiency of each rupee of sales

Orders, Customers & Basket Size

Measure	Formula	Business Meaning
Total_Orders	$\text{DISTINCTCOUNT}(\text{Transaction_ID})$	Number of distinct transactions
Total_Quantity	$\text{SUM}(\text{Quantity})$	Total units sold
Total_Customers	$\text{DISTINCTCOUNT}(\text{Customer_ID})$	Number of unique customers transacting
Total_Stores	$\text{DISTINCTCOUNT}(\text{Store_ID})$	Number of active stores in the chain
Average_Order_Value	$\text{DIVIDE}(\text{Net_Sales}, \text{Total_Orders})$	Typical basket size per transaction

Targets & Variance

Measure	Formula	Business Meaning
Sales_Target	$\text{SUM}(\text{FactTargets}[\text{Sales_Target}])$	Monthly sales target assigned to each store
Profit_Target	$\text{SUM}(\text{FactTargets}[\text{Profit_Target}])$	Monthly profit target assigned to each store
Variance_to_Target	$\text{Net_Sales} - \text{Sales_Target}$	Rupee over/under-shoot against target
Target_Achievement	$\text{DIVIDE}(\text{Net_Sales}, \text{Sales_Target})$	Actual sales as a percentage of target

Returns & Time Intelligence

Measure	Formula	Business Meaning
Completed_Transactions	CALCULATE(DISTINCTCOUNT(Transaction_ID), Transaction_Status = "completed")	Orders that were fulfilled successfully
Returned_Transactions	CALCULATE(DISTINCTCOUNT(Transaction_ID), Returned_Flag = "yes")	Orders that were returned
Return_Rate	DIVIDE(Returned_Transactions, Total_Orders)	Share of orders returned — a risk indicator
Sales_LY	CALCULATE(Net_Sales, SAMEPERIODLASTYEAR(DimDate[Date]))	Net Sales in the same period one year earlier
YoY_Sales_Growth	DIVIDE(Net_Sales – Sales_LY, Sales_LY)	Year-over-year growth rate

7. Visual Analysis by Dashboard Page

Page 1 — Executive Overview

This page establishes the top-line story: Net_Sales of \$41.9M, Gross_Profit of \$14.3M at a 34.05% margin, against a Sales_Target of \$59.2M (70.75% Target_Achievement) and a 6.00% Return_Rate.

- Net Sales by Sales Channel: the donut chart shows an almost even split between Online (51.25%, \$21.46M) and In-Store (48.75%, \$20.42M) — neither channel dominates.
- Net Sales and Sales Target by Month: monthly Net_Sales bars stay in a relatively narrow \$2–4M band across the period, while the Sales_Target line opens sharply higher (roughly \$12–13M in the earliest month) before dropping to a stable \$2–3M range. This early spike is unusually large relative to every later month and is worth re-checking in Raw_Targets for a possible data entry issue (e.g. an annual figure entered into a single month) rather than treating it as a genuine demand pattern.
- Gross Profit and Net Sales by Region: Central region's bars dominate the chart, visually confirming the concentration finding from the table above.

Page 2 — Product & Customer Performance

This page breaks performance down by what is selling and to whom. Total_Quantity across the period is approximately 2,000 units across 243 distinct customers.

- **Top 10 Net Sales by Product:** Nova X2 Smartphone leads at \$5.94M, followed by Pulse Smartwatch (\$4.78M) and ViewMax Monitor (\$3.88M). Notably, Nova X2 outsells its own sibling product, Nova X1 Smartphone (\$1.59M), by roughly 3.7× — suggesting the X2 has substantially displaced the X1 in customer preference.
- **Gross Profit by Product Category and Subcategory:** the treemap shows Electronics (Smartphones, Displays, Laptops, Audio, Wearables) occupying the largest visual area, confirming Electronics as the chain's primary profit driver ahead of Home & Living, Fashion, Sports & Fitness, and Food & Beverages.
- **Net Sales by Customer Segment:** Consumer is the clearly dominant segment, well ahead of both Corporate and Home Office combined — this is a consumer-led retail business, not a B2B-driven one.
- **Top 10 Net Sales by City:** led by Gujranwala, Bahawalpur and Sialkot. Notably, Karachi and Lahore — Pakistan's two largest cities — do not appear in the top 10 by city-level sales, which lines up with the store-level finding on Page 3 that the Karachi and Lahore stores are both under-target.

Page 3 — Store & Target Performance

This page evaluates each store against its monthly target. Across 14 total stores, the chain is carrying a Profit_Target of \$14.34M and an overall Target_Achievement of 0.71 (71%).

- Store-level Target Achievement ranges from a low of 0.55 (Karachi Prime Store) to a high of 0.89 (Rawalpindi Gateway Store) among the stores visible in the table — a 34-point spread that signals real store-to-store performance variation rather than a chain-wide shortfall.

- Variance to Target by Store Name: every visible store shows a negative variance (i.e. every store is under its target to some degree), but the size of the shortfall varies meaningfully — Karachi Prime and Peshawar Commerce show the deepest shortfalls.
- Return Rate by Store Name: Sialkot Gateway Store and Abbottabad Prime Store show the highest return rates of the stores listed, making them priority candidates for a returns-root-cause review.
- Net Sales by Store Type and Region: one Warehouse-format store in the Central region produces a disproportionately large bar (roughly double the next-highest store-type/region combination), indicating that a single high-volume location is carrying an outsized share of one store format's results rather than the pattern being evenly distributed.

9. Insights & Recommendations

Key Findings

- **Regional sales are heavily concentrated in Central:** Central region generates \$19.42M of the \$41.88M total Net_Sales — 46.4% of the entire chain's revenue, and 7.3× the sales of the smallest region, West (\$2.66M).
- **Volume and margin move in opposite directions across regions:** despite leading on revenue, Central holds the lowest Profit_Margin among the four regions (33%), while the lower-volume North and South regions both run a stronger 35% margin — the highest-volume region is not the most efficient one.
- **Karachi and Lahore underperform despite being major markets:** neither city appears in the Top 10 Net Sales by City ranking, and their named stores confirm the pattern at store level — Karachi Prime Store posts the single lowest Target_Achievement in the dataset (55%), and Lahore Commerce Store sits at 75%, both below the chain average of 71%.

- **Product sales are concentrated in a small number of SKUs:** the top 3 products (Nova X2 Smartphone, Pulse Smartwatch, ViewMax Monitor) account for roughly 34.9% of total Net_Sales, and Nova X2 alone outsells its sibling Nova X1 by 3.7×, suggesting strong cannibalization within the same product line.
- **The business is consumer-led, not B2B-led:** the Consumer segment clearly outweighs both Corporate and Home Office combined in Net_Sales by customer segment, meaning retention and promotional strategy should be designed primarily around individual shoppers rather than business accounts.
- **Online and in-store channels are evenly balanced:** Online narrowly leads at 51.25% of Net_Sales versus 48.75% In-Store — close enough that neither channel should be deprioritized in planning or inventory decisions.
- **Every store is currently under target, but by very different margins:** all stores shown on the Store & Target Performance page carry a negative Variance_to_Target, but the shortfall ranges from as little as ~\$552K (Rawalpindi Gateway, 89% achievement) to over \$1.7M (Peshawar Commerce, 57% achievement) — this is a store-execution problem, not solely a target-setting problem.
- **One store-type/region combination is unusually dominant:** Net Sales by Store Type and Region shows a single Warehouse-format store in Central producing a disproportionately large share of that format's total sales, which should be investigated to confirm whether this is a genuinely high-performing flagship location or a data/scope anomaly.

Recommendations

1. Investigate and Support Underperforming Flagship Stores

Karachi Prime Store and Lahore Commerce Store sit in two of Pakistan's largest consumer markets yet rank among the weakest performers against target (55% and 75% respectively). Management should commission a focused review of these two locations — covering staffing, local competition, stock availability and store-specific promotions — before assuming the rest of the chain's strategy applies equally everywhere.

2. Rebalance Regional Strategy Around Margin, Not Just Volume

Because Central drives the most revenue but the lowest margin, leadership should examine the cost or discounting drivers specific to Central (e.g. higher average discount levels or different cost mix) and consider whether North and South's higher-margin approach can be partially replicated there without sacrificing Central's volume advantage.

3. Reduce Reliance on a Narrow Product Set

With the top 3 products driving roughly a third of all sales, the business carries meaningful concentration risk if any one product line falters (supply issue, competitor launch, etc.). A deliberate push to grow Net_Sales contribution from mid-ranked products — cross-promotions, bundling Nova X1 alongside X2, or featured placement for lower-ranked Electronics items — would diversify revenue away from a handful of SKUs.

4. Audit the Early-Period Sales Target for Data Accuracy

The sharp spike in the Sales_Target line at the start of the monthly trend chart is inconsistent with every later month and is more likely a data entry artifact in Raw_Targets than a genuine target-setting

decision. This should be verified against the original target-setting records before the figure is used in any forward planning.
